1 Introduction

This template shows how a paper can pull numbers and tables straight from the analysis pipeline, so the manuscript never falls out of sync with the data. For example, our estimation sample contains 157 observations, and that number is read (dynamically, from the processed data in `2_process`) rather than typed by hand.¹ Citations work as usual: Hail, Lang, and Leuz (2020) discuss reproducibility in accounting research, and the same point can be made parenthetically (Hail, Lang, and Leuz 2020).

¹ You can also write in footnotes.

2 Results

We find a positive and significant association between generative AI use and scaled earnings. See Table 1 below.

— Insert Table 1 about here —

Because the table is generated by the pipeline and imported here, re-running the analysis on new data updates it automatically.
